

The State of On-Site Construction Risk

Why 50% of Field Incidents
Go Unmitigated

2026 Field Risk Analysis

50% of field incidents remain unmitigated — here's why

This report identifies three structural failures and presents an automated capture framework.

1

Documentation gap

Field incidents are never formally documented, preventing root cause analysis and compliance.

2

Data fragmentation

Each subcontractor generates siloed data. The GC lacks unified site risk visibility.

3

Cost multiplier

Indirect costs reach 2–4x the direct incident cost — compounding with repeat events.

Without structured capture, field incidents stay invisible

Industry data suggests that a significant share of field incidents — from near-misses to minor injuries — are never formally documented. Without structured documentation, teams cannot conduct root cause analysis, identify recurring patterns, or demonstrate regulatory compliance.

Contractors end up sifting through texts, emails, and handwritten notes to piece together incident details. This leads to conflicting accounts, incomplete information, and exposure during audits and litigation.

"It can cost you bids, opportunities, and create rework challenges. But it goes further — safety, project costs, pre-construction. Each presents its own challenges in data alignment."

— Brad Buckles, VP Technology & Innovation, Charles Perry Partners

The Automated Capture Framework

Measurable improvements across five dimensions:

	Manual Capture	Automated Capture
Time to document	15–30 min per incident	< 60 seconds (photo + AI)
Data completeness	40–60% of fields filled	95%+ via AI extraction
Audit readiness	Reconstructed retroactively	Real-time, always current
Pattern detection	Manual, quarterly at best	Automated, continuous
Institutional memory	Lost between projects	Cumulative knowledge base

~60%

of construction fatalities
come from the
"Fatal Four" —
all preventable.

Recommended Actions

1

Mandate structured digital capture

Replace paper logs and WhatsApp with a standardized digital workflow. Must work in < 60 seconds.

2

Centralize sub safety data

Require all subs to report through a single platform. Fragmented data = invisible risk.

3

Automate pattern detection

Use AI to surface recurring categories, high-risk phases, and disproportionate events.

4

Measure the documentation ROI

Track time saved, incidents prevented, gaps closed. Quantifiable in 90 days.

From capture to insight in under 60 seconds

BaceTech addresses these findings through a unified platform for active job sites:

- Capture incidents via photo or voice in seconds
- AI generates structured descriptions and identifies causes
- Regulatory standards (OSHA, ABNT NBR, NRs) referenced automatically
- Data centralizes across projects and subcontractors
- Institutional knowledge builds cumulatively

The platform eliminates the documentation gap, breaks subcontractor data silos, and delivers continuous pattern detection.
